

California Toxic tort lawyers handle not only massive personal injury cases in which the injuries caused by exposure to a toxic substance or chemical affect scores, hundreds or thousands. We also handle individual instances of toxic chemical exposure that affect persons in hospitals, nursing homes, schools, shopping malls, fitness centers and other public places. Sources of toxic substances include pharmaceuticals, consumer products, and substances found in the home, the air, the water, the soil and elsewhere in our environment.

If you've been the victim of a chemical toxic exposure, visit our law firm website at <http://www.SebastianGibsonLaw.com> for more information and call us at any of the numbers easily found on our website.

Today, we are all vulnerable to toxic exposure. It has come to the point where almost all of us are or know someone else who has been exposed to things like asbestos, dangerous drugs, contamination of our water supply, or toxic dumping.

Whether you live in the mountains, in the cities, on farm land, in a house or apartment in rural or big city America, you may have been exposed to toxic chemicals.

In the news nearly every day are stories of mass torts involving dangerous chemicals in baby formula, or pet food, ice cream bars, milk, candy, baby cereal or cheese. Recently, there have been dangerous products coming out of China and Mexico, but fertilizer use in agriculture in the U.S. and the raising of other farm animals on a massive scale is an equally dangerous condition for the environment. It may sound funny, but gas emissions from cows are a real barrier to solving global warming and emerging countries like China with a growing desire for meat are adding to that problem.

Some toxic torts are difficult to pin the blame on any one defendant. Mercury in fish is an example. It is abundant. It is toxic. And it has far too many causes over far too many years to now blame one company or one country even over another. However, with new rules such as the new Country of Origin labeling law in states like California, in the future it may be possible to trace foodborne illnesses to certain farms and distributors.

In agricultural areas of California including Orange County, Central California, the Central Coast, San Diego County and the Coachella Valley, toxic tort exposure is a real concern. Sadly, many of the workers most likely to be exposed to such chemicals have the least exposure to quality medical attention or lawyers. When medical attention is sought, unfortunately, many medical providers fail to consider that a person's skin rashes or hair loss may be a symptom of toxic exposure and not due to an allergy or old age.

As years go by, we will find that many of the common items we encounter on a daily basis and take for granted are exposing us to serious danger. Add to that, one-time exposures by tainted food or milk, longer term exposures when the air, water or soil are contaminated and it is no wonder we fight so much disease and sickness in our lives.

Today in order to fight the spread of more and more virulent germs, viruses and pathogens, disinfectants are being made stronger and stronger. If these disinfectants and cleaning solutions are misused, you can be exposed to a lethal dose of toxic chemicals.

Toxic tort lawyers can redress these problems when people come to us with their suspicions, stories of their symptoms and treatment, and we find either the causes or patterns of symptomology. If you think you've been injured as the result of a toxic substance, seek medical attention, visit our law firm website at <http://www.SebastianGibsonLaw.com> and call the law firm of R. Sebastian Gibson immediately.
